

NAME

`sccstring` — echo SCCS keywords to standard output

SYNOPSIS

`sccstring` file

DESCRIPTION

The *sccstring* command will echo SCCS keywords %W% to the standard output surrounded by the appropriate characters to make the entire string a comment. *Sccstring* knows the comment conventions for files whose suffices are:

*.chly], *.mk, [Mm]akefile, *.sh

The output string is a legitimate comment for each of the types of file.

Sccstring is used by the *addscs*(1S) command to automatically add the SCCS keyword string to named files.

SEE ALSO

addscs(1S), *gadd*(1S)

DIAGNOSTICS

All diagnostics are printed on file descriptor 2.

BUGS

There is no way to specify the type of file other than the suffix.
